

# Bees can't wait 5 more years.

## And neither can we.

Honey bees, native bees and other pollinators are responsible for 1 out of every 3 bites of food we eat. Bees pollinate 71 of the 100 crops that make up 90% of the world's food supply. Many fruits and vegetables, including apples, blueberries, strawberries, carrots and broccoli, as well as almonds and coffee, rely on bees. These beneficial insects are critical to maintaining our diverse food supply.

Honey bee populations have been in alarming decline since 2006. Widespread use of a new class of toxic pesticides, neonicotinoids, is a significant contributing factor. In addition to killing bees outright, research has shown that even low levels of these dangerous pesticides impair bees' ability to learn, to find their way back to the hive, to collect food, to produce new queens, and to mount an effective immune response.

This week, 15 countries are imposing a two-year restriction on the use of several of these chemicals. Meanwhile, the United States is **stalling**.

The U.S. Environmental Protection Agency estimates it will be **2018, 5 years from now**, before it makes a decision on this deadly class of pesticides.

**Bees can't wait 5 more years – they are dying now. The U.S. Environmental Protection Agency has the power and responsibility to protect our pollinators. Our nation's food system depends on it.**
